Product Info

The Delkin USB-Bridge provides an easy, inexpensive solution for anyone who wants to copy image, music or data files from one USB compliant device to another. For example, up until now it was impossible for anyone to copy photo images directly from a camera to a portable storage device. The USB-Bridge enables consumers to “connect the dots” when it’s necessary to transfer data from one device to another, regardless if there is a master/host device or not. Consumers can leave their laptops at home when working in the field.
